## DEDICATÓRIA

*Dedico este trabalho ao meu querido avô por ter me inspirado a seguir a carreira médica, à minha mãe e ao meu pai por terem me amado incondicionalmente para que eu chegasse aonde cheguei e ao meu querido irmão por ser meu melhor amigo, parceiro de vida e de profissão.*

*Todo meu sucesso é - e sempre será - graças a vocês.*

## AGRADECIMENTOS

Primeiramente, gostaria de agradecer aos meus pais Fabiana e Waldemar Justino. Todo o sacrifício, apoio e amor incondicional que recebi de vocês moldaram o meu caráter e a minha capacidade de encarar a vida. Vocês são os meus primeiros e mais importantes professores. Espero, um dia, poder retribuir uma parte de tudo que recebi e aprendi.

Agradeço, também, ao meu querido irmão Leonardo Justino. Você é o meu melhor amigo, desde antes de nascermos. Você sempre me motivou a ser alguém melhor, sempre me apoiou e torceu por mim. Sou eternamente grato por ter você ao meu lado, em todos os momentos da minha vida.

Agradeço à minha querida Margrit Müller, que tanto me ajudou durante a minha trajetória pessoal e acadêmica. Você é um exemplo de mulher e de médica, que me ensina e me inspira a cada dia.

Sou grato às amizades que criei e cultivei durante a graduação: Eduardo Ghizzo, Laura Batista, Vitor Marcelo Campos, Mateus Melillo, Iago Koerich, Leonardo Busanello e Thiago Santos. Tenho orgulho de cada um de vocês e me sinto privilegiado em poder compartilhar minha jornada com pessoas tão incríveis.

Agradeço aos meus amigos de infância Eduardo Springmann, Enzo Martioro e Juliano Campos. Nossa amizade manteve-se a mesma apesar de tantas mudanças ao longo dos anos, e, por isso, sinto-me realizado em ter vocês em minha vida.

Agradeço aos meus co-autores neste trabalho, especialmente ao Dr. Rhanderson e ao Dr. Leucker. Os senhores são não somente exemplos de médicos e pesquisadores brilhantes, como também de professores exímios. Poder aprender a arte da pesquisa científica e os conhecimentos na área de Cardiologia com os senhores é um privilégio imensurável.

Por fim, agradeço à minha querida orientadora e professora Dra. Ana Curi Hallal. A senhora é uma médica e professora extraordinária. Desde o início do curso, gerou em mim o interesse pela pesquisa e estatística. Obrigado por me acompanhar ao longo da graduação e ser a minha orientadora neste trabalho no qual tenho orgulho de levar o nome da nossa universidade.

## **Early Initiation of PCSK9 Inhibitor Therapy versus Placebo in Patients with Acute Coronary Syndrome: A Systematic Review and Meta-Analysis**

**Running head:** Early PCSK9i in acute coronary syndrome

**Keywords:** PCSK9 inhibitors; acute coronary syndrome; LDL-cholesterol; lipoprotein (a).

**Word count:** 2,140

## ABSTRACT

In patients with stable atherosclerotic cardiovascular disease, PCSK9 inhibitors (PCSK9i) have shown a 50-60% reduction in LDL-C from baseline, added to high-intensity statin therapy. However, less is known about the impact of PCSK9i in the setting of an acute coronary syndrome (ACS). Therefore, we performed a systematic review and meta-analysis comparing PCSK9i with placebo in the setting of ACS, added to guideline directed high-intensity or maximally tolerated statin therapy. We included randomized controlled trials (RCTs) with initiation of PCSK9i or placebo within 1 week of presentation or percutaneous coronary intervention for ACS. PubMed, EMBASE, and Cochrane Central were searched. This study followed Cochrane and PRISMA recommendations. Six RCTs were included, totalizing 996 patients of whom 503 (50.5%) received PCSK9i. Mean follow-up ranged from 4 to 52 weeks. LDL-C (MD -44 mg/dL; CI -54.3 to -33.8;  $p < 0.001$ ) and Lp(a) levels (MD -24.0 nmol/L; CI -43.0 to -4.9;  $p = 0.01$ ) were significantly lower at follow-up with PCSK9i. Similarly, total cholesterol (MD -49.2 mg/dL; CI -59 to -39.3), triglycerides (MD -19 mg/dL; CI -29.9 to -8.2) and Apo B (MD -33.3 mg/dL; CI -44.4 to -22.1) were significantly reduced with PCSK9i. In conclusion, in patients with ACS, early initiation of PCSK9i, added to statin, significantly reduces LDL-C and Lp(a) as compared with placebo. Whether the differences in these atherogenic lipoproteins translate into a reduction in clinical endpoints is yet to be determined.

Patients with acute coronary syndromes (ACS) are at high risk for recurrent ischemic events in the early stages after the index event, leading to a 20% increase in the recurrence rate within 3 years.<sup>1,2</sup> Previous randomized trials have shown that early lipid-lowering therapy with high intensity statin rapidly reduces recurrent atherosclerotic events.<sup>3-5</sup> The European Society of Cardiology (ESC) Guidelines recommend lowering low-density lipoprotein cholesterol (LDL-C) levels to <55 mg/dL and  $\leq$ 50% from baseline, whereas the American Heart Association/American College of Cardiology (AHA/ACC) recommends lowering LDL-C levels to <70 mg/dL and  $\leq$ 50% from baseline.<sup>6-8</sup> This should happen in a stepwise approach that includes maximally-tolerated statin therapy and, if needed, non-statin therapy, including proprotein convertase subtilisin/kexin 9 inhibitors.<sup>6-8</sup> Recently, the ACC Expert Consensus stated that adults with clinical atherosclerotic cardiovascular disease (ASCVD) at very high risk on statin regimen should aim LDL-C levels <55 mg/dL.<sup>9</sup> In patients with stable atherosclerotic disease, evolocumab significantly reduced the risk of any coronary revascularization by 22% and complex revascularizations by 29%, as compared with placebo, over a median follow-up of 2.2 years.<sup>10,11</sup> In patients with a history of ACS within the prior 1 to 12 months (median 2.6 [1.7-4.4] months) of trial enrolment, there was a significant 15% reduction in the risk of major cardiovascular events among those treated with alirocumab in the ODYSSEY OUTCOMES trial.<sup>12</sup> Less is known, however, about the use of PCSK9 inhibitors in patients soon after a presentation with ACS. There is some evidence of greater plaque regression in patients treated with PCSK9 inhibitors immediately after a presentation with ACS.<sup>13,14</sup> Recent randomized controlled trials have investigated the role of PCSK9i administration in the acute setting of ACS. Therefore, we aimed to perform a systematic review and meta-analysis comparing the impact of PCSK9i and statin therapy on atherogenic lipoprotein levels with statin monotherapy in patients presenting with ACS.

## METHODS

We systematically searched Embase, Cochrane Central Register of Controlled Trials (CENTRAL), and PubMed from inception to January 12, 2023, for studies published in English with the following medical subject heading terms: ‘acute coronary syndrome’, ‘ACS’, ‘proprotein convertase subtilisin/kexin type 9 inhibitor’, ‘PCSK9 inhibitor’, ‘alirocumab’, ‘evolucumab’, ‘angiography’, ‘postinfarction’, ‘percutaneous coronary intervention’ and ‘PCI’. Additionally, we evaluated the references of included trials for additional studies and contacted authors for unpublished data. We performed the systematic review and meta-analysis in agreement with the recommendations from the Cochrane Collaboration and the Preferred Reporting Items for Systematic Reviews and Meta-Analysis (PRISMA) statement guidelines.<sup>15,16</sup> This study is registered with PROSPERO (CRD42022364868).

We included studies that met the following criteria: (1) randomized controlled trials (RCTs) comparing PCSK9i with placebo; in (2) patients presenting with ACS; (3) with initiation of PCSK9i therapy within 1 week of presentation for PCI or ACS; and (4) reporting any of the outcomes of interest - serum levels of LDL-C, Lp(a), HDL-C, triglycerides, total cholesterol and apolipoprotein B (Apo B). We excluded nonrandomized studies and studies that administered the first dose of PCSK9i or placebo more than 1 week after ACS presentation or PCI.

Two authors (G.B.J. and L.B.J.) independently extracted relevant data following predetermined methods of search, quality assessment and data extraction. Disagreements were resolved by consensus between authors (G.B.J., L.B.J. and M.E.M.).

Risk of bias and quality assessment of individual studies were analyzed with the Cochrane Collaboration’s tool for assessing risk of bias in randomized trials (RoB 2).<sup>15</sup> The RoB2 tool ranks RCTs as high, low, or unclear risk of bias based on five domains: selection,

performance, detection, attrition, and reporting biases. Funnel plots of individual study weights against point estimates were used to check for evidence of publication bias.

Treatment effects were compared using pooled odds-ratios (ORs) and mean differences (MDs) with 95% confidence intervals (CIs) for dichotomous and continuous endpoints, respectively. We evaluated heterogeneity with Cochran Q test and  $I^2$  statistics; P values inferior to 0.10 and  $I^2 > 25\%$  were considered significant for heterogeneity. We used a fixed-effect model for endpoints with  $I^2 < 25\%$  (low heterogeneity). DerSimonian and Laird random-effects model was assessed in pooled outcomes with high heterogeneity. P values of  $< 0.05$  were considered statistically significant. Statistics were analyzed with Review Manager 5.4 (Nordic Cochrane Centre, The Cochrane Collaboration).

## RESULTS

As described in Figure 1, our initial search strategy yielded 1,260 results. After exclusion of duplicate records and studies based on title and abstract, 24 trials were thoroughly reviewed for the inclusion and exclusion criteria. Finally, 996 patients from 6 RCTs were included in the systematic review and meta-analysis, of whom 503 (50.5%) received PCSK9i therapy.<sup>13,14,17-20</sup> Characteristics of each study are detailed in Table 1. Among the intervention group, 317 (63%) participants received evolocumab and 186 (37%) received alirocumab. Mean time from presentation to administration of first dose ranged from 3.6 hours to 6.5 days.

After a mean follow-up ranging from 4 to 52 weeks, LDL-C was significantly lower in those who received an early administration of PCSK9i compared with placebo (MD -44.0 mg/dL; 95% CI -54.3 to -33.8 mg/dL;  $p < 0.001$ ; Figure 2A). The percent change of this lipoprotein from baseline was significantly greater in patients who received PCSK9i therapy relative to placebo (MD -38.0%; 95% CI -46.5 to -29.7%;  $p < 0.001$ ; Figure 2B). Lp(a) levels

were also significantly reduced in those who received either evolocumab or alirocumab therapy (MD -24.0 nmol/L; 95% CI -43.0 to -4.9 nmol/L;  $p=0.01$ ; Figure 2C). Similarly, serum levels of total cholesterol (MD -49.2 mg/dL; 95% CI -59 to -39.3 mg/dL;  $p<0.001$ ; Figure 3A), triglycerides (MD -19.0 mg/dL; 95% CI -29.9 to -8.2 mg/dL;  $p<0.001$ ; Figure 3B) and Apo B (MD -33.3 mg/dL; 95% CI -44.4 to -22.1 mg/dL;  $p<0.001$ ; Figure 3C) were significantly lower at follow-up in the intervention group as compared with control. HDL cholesterol levels were marginally higher in patients treated with PCSK9i therapy (MD 2.5 mg/dL; 95% CI 0.9 to 4.2 mg/dL;  $p=0.003$ ; Figure 3D).

The proportion of patients who achieved an LDL-C  $<55$  mg/dL and  $<70$  mg/dL was 91% and 96%, respectively, for patients treated with PCSK9i therapy, as compared with 20% and 44%, respectively, of those in the placebo group (Figures 3E and 3F).

Adverse events of any cause happened in 44% of the participants treated with PCSK9i and in 48% of those in the placebo group, with no statistical significance (OR 0.85; 95% CI 0.64 to 1.13;  $p=0.27$ ; Figure 4). Myalgia and local injection site reactions were the most common reported adverse events, accounting for 5.6% and 3.9% of cases in the PCSK9i and placebo groups, respectively.

Quality appraisal of each RCT is detailed in eTable 1 in the Supplement. Overall, studies were classified as low for the risk of bias. Albeit restricted by the small number of trials, funnel plot analysis indicated no evidence of publication bias (eFigure 2 in the Supplement). We performed sensitivity analyses by systematically excluding each study from the pooled outcomes, which showed consistency among results.

## DISCUSSION

In this systematic review and meta-analysis of six studies and 996 patients, we compared early administration of PCSK9i with placebo in patients presenting with ACS. The

main findings were as follows: (1) the levels of LDL-C were reduced by approximately 45 mg/dL among those who received an early administration of PCSK9i compared with placebo (75.5% vs. 39.0%, respectively; MD -44.0 mg/dL;  $p < 0.001$ ); (2) Lp(a) levels were significantly lower in participants treated with either alirocumab or evolocumab therapy over a follow-up period of 4 to 52 weeks (MD -24.0 nmol/L; 95% CI -43.0 to -4.9 nmol/L;  $p = 0.01$ ); (3) this improvement was also observed for total cholesterol, and triglycerides levels ( $p < 0.01$ ); and (4) patients receiving PCSK9i therapy exhibited slightly higher levels of serum HDL cholesterol.

Individuals presenting with ACS are at an increased risk of recurrent cardiovascular events. Multisociety European and American guidelines on prevention and lipid management recommend high-statin therapy (or maximally-tolerated statin) to achieve strict LDL-C goals after ACS ( $\leq 50\%$  from baseline and  $< 55$  mg/dL or  $< 70$  mg/dL).<sup>6-9</sup> If this level is not achieved in up to 6 weeks despite maximally tolerated statin therapy, additional lipid lowering therapy should be added, which now includes a gamut of options for oral and injectable medications. Despite these recommendations, it is well known that reaching optimal levels of LDL-C remains challenging in these very-high-risk patients, which delays the benefits of secondary prevention.<sup>2</sup> PCSK9i reduce mortality in patients with a history of ACS, when initiated 1-12 months after an ACS for patients with LDL-C  $\geq 70$  mg/dL.<sup>12,21</sup> Therefore, an early administration of PCSK9i within 4 weeks of an ACS may help to achieve guideline LDL-C goals quicker and ultimately reduce recurrent cardiovascular events in this population, although the latter remains to be determined.

PCSK9 inhibitors have also been shown to reduce percent atheroma volume relative to placebo in patients with stable coronary artery disease and in those with acute myocardial infarction.<sup>13,22</sup> PACMAN-AMI evaluated the effects of biweekly administration of alirocumab added to rosuvastatin compared with statin therapy alone on coronary plaque composition,

evolution and phenotype, among patients with acute myocardial infarction.<sup>13</sup> Alirocumab was administered within 24 hours of PCI of the culprit lesion. There was a statistically significant reduction in mean percent atheroma volume in the alirocumab group from baseline to week 52 (-2.13% vs. -0.92%;  $p < 0.001$ ). This reduction was greater than the one achieved by the GLAGOV trial, which enrolled patients with stable CAD (0.05% vs. -0.95%;  $p < 0.001$ ).<sup>22</sup> Moreover, in PACMAN-AMI, maximum lipid core burden index within 4 mm was significantly lower in the PCSK9i group (-79.42 vs. -37.60;  $p = 0.006$ ) and fibrous cap thickness was significantly increased in the same population (62.67  $\mu\text{m}$  vs. 33.19  $\mu\text{m}$ ;  $p = 0.001$ ).<sup>13</sup> These findings suggest that the early initiation of PCSK9i may be beneficial in secondary prevention not only by reducing lipid serum levels, but also by modifying coronary plaque phenotype.

The ODYSSEY OUTOMES and FOURIER trials demonstrated clinical efficacy and safety of PCSK9i in individuals with a more stable phenotype of atherosclerotic disease, enrolled no sooner than 1 month after ACS.<sup>11,12</sup> Our systematic review and meta-analysis extend the findings of these clinical trials in lipid endpoints to the more acute setting, early after presentation with ACS (within one week). The EPIC-STEMI trial aimed to evaluate not only the degree of reduction of LDL-C, but also the time interval in which the effects of PCSK9i therapy were seen. Within the first 24 hours after PCI for STEMI, those who received alirocumab experienced a slightly higher rate of reduction in LDL-C (-0.001 mmol/L/h;  $p = 0.032$ ). Ultimately, 92% of the participants in the PCSK9i group reached ESC/EAS recommended LDL-C levels of  $< 55$  mg/dL, as opposed to 57% in the placebo group, over a median follow-up of 45 days ( $p = 0.002$ ).<sup>20</sup> In our study, 4 trials assessed the number of patients who achieved guideline recommended goals of LDL-C at 4 weeks after ACS;<sup>17-20</sup> 91% of patients who underwent PCSK9i therapy achieved mean values of LDL-C  $< 55$  mg/dL as compared with only 20% of those who received statin monotherapy ( $p < 0.001$ ).

The target of LDL-C <70 mg/dL was achieved by 96% in the PCSK9i group compared with 44% in the placebo group (p<0.001).

Lp(a) is also a key determinant of atherosclerotic risk.<sup>23,24</sup> This lipoprotein carries cholesterol, oxidized phospholipids and limits thrombolysis by competing with plasminogen at the fibrin binding site.<sup>25-27</sup> Patients with elevated levels of Lp(a) also tend to experience great absolute risk reductions from PCSK9i therapy.<sup>28,29</sup> In patients with stable coronary heart disease, evolocumab reduces Lp(a) levels by 20-30%.<sup>28</sup> In the setting of an ACS, there is a significant increase in Lp(a) levels in the placebo group as early as 24 hours after the index event, particularly in those with elevated Lp(a) at baseline.<sup>30,31</sup> Evolocumab may blunt this increase in Lp(a) during an acute myocardial infarction by inhibiting mature PCSK9.<sup>30</sup> In our meta-analysis, PCSK9i lowered Lp(a) levels by approximately 8%; however, Lp(a) increased by 18% in the placebo group (MD -24.0 nmol/L; 95% CI -43.0 to -4.9 nmol/L; p=0.01).

Our study has limitations. First, the individual studies and their pooled results in this meta-analysis are not powered to detect a significant difference in clinical outcomes between groups. EVOLVE-MI (ClinicalTrials.gov: NCT05284747) and AMUNDSEN (ClinicalTrials.gov: NCT04951856) are two ongoing multicenter, open-label, RCTs that aim to evaluate early and long-term effects of evolocumab in patients who present with ACS. Second, only 2 of the included RCTs had a longer follow-up of 52 weeks. And, finally, the absence of patient-level data from most of the studies precluded detailed subgroup analyses, such as exploring the effects in patients who were previously on statin vs. statin-naïve.

In conclusion, in this meta-analysis of RCTs, patients who were treated with PCSK9i therapy within one week of an ACS had lower levels of LDL-C and Lp(a) as compared with statin monotherapy. To the extent that lower levels of these atherogenic lipoproteins are associated with improved clinical outcomes, these findings provide support for early

treatment with PCSK9 inhibitors in patients who present with ACS. Cardiovascular outcome trials are warranted to evaluate clinical endpoints in this patient population.

## **DISCLOSURES**

Dr. Leucker has received grants from American Heart Association Career Development Award, National Institutes of Health, Merck and Amgen. The remaining authors declare no conflicts of interest.

## **ACKNOWLEDGEMENTS**

We are grateful to the authors of the clinical trials included in this manuscript for their research, which supported the meta-analysis.

## FIGURE LEGENDS

Figure 1. PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-analysis)

Flow Diagram

Figure 2. Primary Outcomes

Figure 2A. LDL-C was significantly reduced with PCSK9 inhibitor therapy relative to placebo (mg/dL).

Figure 2B. The relative change in LDL-C from baseline was significantly greater with PCSK9 inhibitor therapy relative to placebo (%).

Figure 2C. Lp(a) was significantly reduced with PCSK9 inhibitor therapy relative to placebo (nmol/L).

Figure 3. Secondary Outcomes

Figure 3A. Total cholesterol was significantly reduced with PCSK9 inhibitor therapy relative to placebo (mg/dL).

Figure 3B. Triglycerides were significantly reduced with PCSK9 inhibitor therapy relative to placebo (mg/dL).

Figure 3C. Apo B levels were significantly reduced with PCSK9 inhibitor therapy relative to placebo (mg/dL).

Figure 3D. HDL-C was significantly increased with PCSK9 inhibitor therapy relative to placebo (mg/dL).

Figure 3E. The number of patients who achieved LDL-C <55 mg/dL at 4 weeks was significantly higher in those treated with PCSK9i as compared with placebo.

Figure 3F. The number of patients who achieved LDL-C <70 mg/dL at 4 weeks was significantly higher in those treated with PCSK9 inhibitors as compared with placebo.

Figure 4. The incidence of any adverse events was not significantly different in those treated with PCSK9 inhibitors as compared with placebo.

**Table 1.** Baseline Characteristics of Included Studies

	Number of patients, n	PCSK9i, n (%)	Time to first dose of PCSK9i, $\pm$ SD	Males, n (%)	Mean age, $\pm$ SD (years)	ACS PCSK9i, n (%)	ACS placebo, n (%)	Previous statin treatment, n (%) <sup>b</sup>	HTN, n (%)	DM, n (%) <sup>c</sup>	Previous MI, n (%)	Previous PCI, n (%)	Follow-up (weeks)
EVOPACS 2019	308	Evolocumab: 155 (50.3) Placebo: 153 (49.7)	<72h after NSTE-ACS < 24h after STEMI	Evolocumab: 128 (83) Placebo: 123 (80)	Evolocumab: 60.5 $\pm$ 12 Placebo: 61 $\pm$ 10.7	NSTE-ACS: 88 (57) STEMI: 67 (43)	NSTE-ACS: 107 (70) STEMI: 46 (30)	Evolocumab: 31 (20) Placebo: 36 (24)	Evolocumab: 79 (51) Placebo: 85 (56)	Evolocumab: 23 (15) Placebo: 24 (16)	Evolocumab: 24 (15) Placebo: 19 (12)	Evolocumab: 25 (16) Placebo: 23 (15)	8

**eFigure 1. Funnel plots for LDL-C levels at follow-up (1A), % change of LDL-C from baseline (1B), Lp(a) levels at follow-up (1C), total cholesterol levels at follow-up (1D), triglycerides levels at follow-up (1E), Apo B levels at follow-up (1F), HDL-C levels at follow-up (1G), number of participants with LDL-C <55 mg/dL at 4 weeks (1H), and number of participants with LDL-C <70 mg/dL at 4 weeks (1I) and adverse events of any cause (1J) showed no definitive evidence of publication bias.**

## **ANEXO 1: Normas de publicação da revista American Journal of Cardiology**

### **Your Paper Your Way**

We now differentiate between the requirements for new and revised submissions. You may choose to submit your manuscript as a single Word or PDF file to be used in the refereeing process. Only when your paper is at the revision stage, will you be requested to put your paper in to a 'correct format' for acceptance and provide the items required for the publication of your article.

**To find out more, please visit the Preparation section below.**

### **Introduction**

Published 24 times a year, *The American Journal of Cardiology*<sup>®</sup> is an international journal designed for cardiovascular disease specialists and internists with a subspecialty in cardiology. *AJC* is an independent, scientific, peer-reviewed journal of original articles that focus on the practical, clinical approach to the diagnosis and treatment of cardiovascular disease. *AJC* has one of the fastest acceptance to publication times in cardiology. Articles report on systemic hypertension, methodology, drugs, pacing, arrhythmia, preventive cardiology, congestive heart failure, valvular heart disease, congenital heart disease, and cardiomyopathy. Also included are editorials, readers' comments, and symposia.

### **Before you begin**

#### **Ethics in publishing**

Please see our information on [Ethics in publishing](#).

#### **Human rights**

If the work reported involves the use of human subjects, the author should ensure that the work described has been carried out in accordance with The Code of Ethics of the World Medical Association (Declaration of Helsinki) for experiments involving humans <https://www.wma.net/policies-post/wma-declaration-of-helsinki-ethical-principles-for-medical-research-involving-human-subjects/> ; Uniform Requirements for manuscripts submitted to Biomedical journals <http://www.icmje.org>. The author should include a

statement in the manuscript that informed consent was obtained for experimentation with human subjects. The privacy rights of human subjects must always be observed.

### **Declaration of competing interest**

Corresponding authors, on behalf of all the authors of a submission, must disclose any financial and personal relationships with other people or organizations that could inappropriately influence (bias) their work. Examples of potential conflicts of interest include employment, consultancies, stock ownership, honoraria, paid expert testimony, patent applications/registrations, and grants or other funding. All authors, including those *without* competing interests to declare, should provide the relevant information to the corresponding author (which, where relevant, may specify they have nothing to declare). Corresponding authors should then use [this tool](#) to create a shared statement and upload to the submission system at the Attach Files step. **Please do not convert the .docx template to another file type. Author signatures are not required.**

### **Declaration of generative AI in scientific writing**

The below guidance only refers to the writing process, and not to the use of AI tools to analyse and draw insights from data as part of the research process.

Where authors use generative artificial intelligence (AI) and AI-assisted technologies in the writing process, authors should only use these technologies to improve readability and language. Applying the technology should be done with human oversight and control, and authors should carefully review and edit the result, as AI can generate authoritative-sounding output that can be incorrect, incomplete or biased. AI and AI-assisted technologies should not be listed as an author or co-author, or be cited as an author. Authorship implies responsibilities and tasks that can only be attributed to and performed by humans, as outlined in Elsevier's [AI policy for authors](#).

Authors should disclose in their manuscript the use of AI and AI-assisted technologies in the writing process by following the instructions below. A statement will appear in the published work. Please note that authors are ultimately responsible and accountable for the contents of the work.

### ***Disclosure instructions***

Authors must disclose the use of generative AI and AI-assisted technologies in the writing process by adding a statement at the end of their manuscript in the core manuscript file, before the References list. The statement should be placed in a new section entitled ‘Declaration of Generative AI and AI-assisted technologies in the writing process’.

*Statement: During the preparation of this work the author(s) used [NAME TOOL / SERVICE] in order to [REASON]. After using this tool/service, the author(s) reviewed and edited the content as needed and take(s) full responsibility for the content of the publication.*

This declaration does not apply to the use of basic tools for checking grammar, spelling, references etc. If there is nothing to disclose, there is no need to add a statement.

### **Submission declaration and verification**

Submission of an article implies that the work described has not been published previously (except in the form of an abstract, a published lecture or academic thesis, see '[Multiple, redundant or concurrent publication](#)' for more information), that it is not under consideration for publication elsewhere, that its publication is approved by all authors and tacitly or explicitly by the responsible authorities where the work was carried out, and that, if accepted, it will not be published elsewhere in the same form, in English or in any other language, including electronically without the written consent of the copyright-holder. To verify compliance, your article may be checked by [Crossref Similarity Check](#) and other originality or duplicate checking software.

### ***Preprints***

Please note that [preprints](#) can be shared anywhere at any time, in line with Elsevier's [sharing policy](#). Sharing your preprints e.g. on a preprint server will not count as prior publication (see '[Multiple, redundant or concurrent publication](#)' for more information).

### **Use of inclusive language**

Inclusive language acknowledges diversity, conveys respect to all people, is sensitive to differences, and promotes equal opportunities. Content should make no assumptions about the beliefs or commitments of any reader; contain nothing which might imply that one individual is superior to another on the grounds of age, gender, race, ethnicity, culture, sexual orientation, disability or health condition; and use inclusive language throughout. Authors

should ensure that writing is free from bias, stereotypes, slang, reference to dominant culture and/or cultural assumptions. We advise to seek gender neutrality by using plural nouns ("clinicians, patients/clients") as default/wherever possible to avoid using "he, she," or "he/she." We recommend avoiding the use of descriptors that refer to personal attributes such as age, gender, race, ethnicity, culture, sexual orientation, disability or health condition unless they are relevant and valid. When coding terminology is used, we recommend to avoid offensive or exclusionary terms such as "master", "slave", "blacklist" and "whitelist". We suggest using alternatives that are more appropriate and (self-) explanatory such as "primary", "secondary", "blocklist" and "allowlist". These guidelines are meant as a point of reference to help identify appropriate language but are by no means exhaustive or definitive.

## **Reporting sex- and gender-based analyses**

### ***Reporting guidance***

For research involving or pertaining to humans, animals or eukaryotic cells, investigators should integrate sex and gender-based analyses (SGBA) into their research design according to funder/sponsor requirements and best practices within a field. Authors should address the sex and/or gender dimensions of their research in their article. In cases where they cannot, they should discuss this as a limitation to their research's generalizability. Importantly, authors should explicitly state what definitions of sex and/or gender they are applying to enhance the precision, rigor and reproducibility of their research and to avoid ambiguity or conflation of terms and the constructs to which they refer (see Definitions section below). Authors can refer to the [Sex and Gender Equity in Research \(SAGER\) guidelines](#) and the [SAGER guidelines checklist](#). These offer systematic approaches to the use and editorial review of sex and gender information in study design, data analysis, outcome reporting and research interpretation - however, please note there is no single, universally agreed-upon set of guidelines for defining sex and gender.

### ***Definitions***

Sex generally refers to a set of biological attributes that are associated with physical and physiological features (e.g., chromosomal genotype, hormonal levels, internal and external anatomy). A binary sex categorization (male/female) is usually designated at birth ("sex assigned at birth"), most often based solely on the visible external anatomy of a newborn. Gender generally refers to socially constructed roles, behaviors, and identities of women, men

and gender-diverse people that occur in a historical and cultural context and may vary across societies and over time. Gender influences how people view themselves and each other, how they behave and interact and how power is distributed in society. Sex and gender are often incorrectly portrayed as binary (female/male or woman/man) and unchanging whereas these constructs actually exist along a spectrum and include additional sex categorizations and gender identities such as people who are intersex/have differences of sex development (DSD) or identify as non-binary. Moreover, the terms "sex" and "gender" can be ambiguous—thus it is important for authors to define the manner in which they are used. In addition to this definition guidance and the SAGER guidelines, the [resources on this page](#) offer further insight around sex and gender in research studies.

### **Author contributions**

For transparency, we require corresponding authors to provide co-author contributions to the manuscript using the relevant CRediT roles. The [CRediT taxonomy](#) includes 14 different roles describing each contributor's specific contribution to the scholarly output. The roles are: Conceptualization; Data curation; Formal analysis; Funding acquisition; Investigation; Methodology; Project administration; Resources; Software; Supervision; Validation; Visualization; Roles/Writing - original draft; and Writing - review & editing. Note that not all roles may apply to every manuscript, and authors may have contributed through multiple roles. [More details and an example](#).

### **Changes to authorship**

Authors are expected to consider carefully the list and order of authors **before** submitting their manuscript and provide the definitive list of authors at the time of the original submission. Any addition, deletion or rearrangement of author names in the authorship list should be made only **before** the manuscript has been accepted and only if approved by the journal Editor. To request such a change, the Editor must receive the following from the **corresponding author**: (a) the reason for the change in author list and (b) written confirmation (e-mail, letter) from all authors that they agree with the addition, removal or rearrangement. In the case of addition or removal of authors, this includes confirmation from the author being added or removed.

Only in exceptional circumstances will the Editor consider the addition, deletion or rearrangement of authors **after** the manuscript has been accepted. While the Editor considers

the request, publication of the manuscript will be suspended. If the manuscript has already been published in an online issue, any requests approved by the Editor will result in a corrigendum.

### *Article transfer service*

This journal uses the Elsevier Article Transfer Service to find the best home for your manuscript. This means that if an editor feels your manuscript is more suitable for an alternative journal, you might be asked to consider transferring the manuscript to such a journal. The recommendation might be provided by a Journal Editor, a dedicated [Scientific Managing Editor](#), a tool assisted recommendation, or a combination. If you agree, your manuscript will be transferred, though you will have the opportunity to make changes to the manuscript before the submission is complete. Please note that your manuscript will be independently reviewed by the new journal. [More information](#).

### **Article transfer service**

This journal is part of our Article Transfer Service. This means that if the article is not accepted for publication in AJC, the Editor in Chief may suggest the possibility of transferring it to another journal for consideration for publication. You may accept or decline; if you accept, your article will be transferred automatically on your behalf with no need to reformat. More information about this can be found here: <https://www.elsevier.com/authors/article-transfer-service>.

### **Copyright**

Upon acceptance of an article, authors will be asked to complete a 'Journal Publishing Agreement' (see [more information](#) on this). An e-mail will be sent to the corresponding author confirming receipt of the manuscript together with a 'Journal Publishing Agreement' form or a link to the online version of this agreement.

Subscribers may reproduce tables of contents or prepare lists of articles including abstracts for internal circulation within their institutions. [Permission](#) of the Publisher is required for resale or distribution outside the institution and for all other derivative works, including compilations and translations. If excerpts from other copyrighted works are included, the author(s) must obtain written permission from the copyright owners and credit the source(s) in the article. Elsevier has [preprinted forms](#) for use by authors in these cases.

For gold open access articles: Upon acceptance of an article, authors will be asked to complete a 'License Agreement' ([more information](#)). Permitted third party reuse of gold open access articles is determined by the author's choice of [user license](#).

### ***Author rights***

As an author you (or your employer or institution) have certain rights to reuse your work. [More information](#).

### ***Elsevier supports responsible sharing***

Find out how you can [share your research](#) published in Elsevier journals.

### **Role of the Funding Source**

Please identify who provided financial support for the research and/or preparation of the article and briefly describe the role of the sponsor(s), if any, in study design; in the collection, analysis, and interpretation of data; in writing the report; and in the decision to submit the article for publication. If the funding source(s) had no such involvement then this should be stated. Please see <https://www.elsevier.com/funding>.

### **Funding Body Agreements and Policies**

Elsevier has established agreements and developed policies to allow authors whose articles appear in journals published by Elsevier to comply with potential manuscript archiving requirements as specified as conditions of their grant awards. To learn more about existing agreements and policies please visit <https://www.elsevier.com/fundingbodies>.

### **Open access**

Please visit our [Open Access page](#) for more information about open access publishing in this journal.

### **Language services**

Authors who feel their English language manuscript may require editing to eliminate possible grammatical or spelling errors and to conform to correct scientific English may wish to use the English language editing service available from Elsevier's WebShop.

See <https://webshop.elsevier.com/language-editing/> or visit our customer support site <https://service.elsevier.com> for more information.

## **Submission**

Submission to this journal for full length reports, case reports, review articles, editorials, historical studies, proceeds totally online and you will be guided stepwise through the creation and uploading of your files. The system automatically converts source files to a single PDF file of the article, which is used in the peer-review process. Please note that even though manuscript source files are converted to PDF files at submission for the review process, these source files are needed for further processing after acceptance. All correspondence, including notification of the Editor's decision and requests for revision, takes place by e-mail, eliminating the need for a paper trail.

### ***Submit your article***

Please submit your article via <https://www.editorialmanager.com/ajc>.

## **Preparation**

### **Peer review**

This journal operates a single anonymized review process. All contributions will be initially assessed by the editor for suitability for the journal. Papers deemed suitable are then typically sent to a minimum of two independent expert reviewers to assess the scientific quality of the paper. The Editor is responsible for the final decision regarding acceptance or rejection of articles. The Editor's decision is final. Editors are not involved in decisions about papers which they have written themselves or have been written by family members or colleagues or which relate to products or services in which the editor has an interest. Any such submission is subject to all of the journal's usual procedures, with peer review handled independently of the relevant editor and their research groups. [More information on types of peer review.](#)

**MANUSCRIPTS** are received with the understanding that they are submitted solely to *The American Journal of Cardiology* and, that upon submission they become the property of the Publisher, that the work has not been previously published, and that the data in the manuscripts have been reviewed by all authors, who agree with the analyses of the data and the conclusions reached in the manuscript. The publisher reserves copyright and renewal on

all published material, and such material may not be reproduced without the written permission of the Publisher. Statements in articles are the responsibility of the authors. The *Journal* does not accept original articles involving animal research.

The cover letter should state precisely and concisely the significance and uniqueness of the work in the authors' view. The authors may state the extent of any concessions they are prepared to make (for example, the elimination of 1 or more figures or tables or a portion of the text) to increase the likelihood of publication of their work in the Journal. If possible, names and email addresses should be provided of non-local experts who, in the view of the author(s), could provide objective and informed reviews of their work. The names of investigators considered unlikely to give nonbiased reviews of their work also may be submitted. This request is honored.

Please note that an editable file is needed for production purposes after acceptance, and we ask that you submit source files at revision stage in the event your manuscript is accepted.

When revising your manuscript, study recent past issues of the Journal for format. Arrange the paper as follows: (1) title page, which should include the title, the full names and academic degrees of the authors, and current affiliations of all authors; (2) abstract; (3) text; (4) acknowledgement; (5) references; (6) figure legends; (7) tables; and (8) figures. Number the title page as 1, abstract page as 2 with the introduction beginning on page #3 and so forth. Type double-spaced (including references) with at least 25-mm (1-inch) margins, sized for 8.5 x 11 inch paper. Files should be labeled with appropriate and descriptive file names. Upload text, tables and graphics as separate files. Do not import figures or tables into the text document. Complete instructions for electronic artwork submission can be found on the Author Gateway, accessible through the journal home page.

### **Title Page and Abstract**

For the **complete title page**, include the full first or middle and last names of all authors. List the current affiliations of all authors and link author names and affiliations by “a,” “b,” “c,” etc., after the author names and before the affiliation. Provide information about grant support if necessary, including the location (City/state/country). If work described is supported by a grant from a pharmaceutical company, that fact should be stated on the title page. Add at the bottom the phrase "Corresponding author" followed a telephone number, email address, and

mailing address. Add a **2-to 6-word** running head. Limit the **abstract** to 250 words or a single page. List **2 to 4 key words** for subject indexing at the end of the abstract.

### **Highlights**

Highlights are optional yet highly encouraged for this journal, as they increase the discoverability of your article via search engines. They consist of a short collection of bullet points that capture the novel results of your research as well as new methods that were used during the study (if any). Please have a look at the [example Highlights](#).

Highlights should be submitted in a separate editable file in the online submission system. Please use 'Highlights' in the file name and include 3 to 5 bullet points (maximum 85 characters, including spaces, per bullet point).

### **Style**

Use the required 3 major headings throughout the body of the text, such as Methods, Results, and Discussion. Do not use subheadings under these headings. Tables, figures, and references must be cited in numerical order throughout the manuscript. Abbreviations are permitted, but usually no more than 5 or 6 per manuscript (at the Editor's discretion), and then they must be used on every page of the manuscript after they are initially spelled out (followed by the abbreviation) in both abstract and introduction. Use generic names of drugs. Do not spell out any number, including those less than 10, except when used for opening a sentence, but try not to begin sentences with a number. Use symbols for less than (<), greater than (>) and percent (%). Indent all paragraphs after the abstract and introduction. Both the abstract and introduction should be a single paragraph. Consult the Uniform Requirements for Manuscripts Submitted to Biomedical Journals, published in *The Annals of Internal Medicine* June 1982;96:766-771, and also the *Stylebook/Editorial Manual of the AMA*.

### **Figures**

Number figures in order in which they are mentioned in the text. Type figure legends on a separate page, double-spaced, after the references within the text document. Clearly mark figures with a, b, c, top, bottom, right and left.

Download each figure as a separate file (.tif .eps, .jpeg formats are preferred, although .ppt, .xls, .pdf, and .doc files are accepted.). Do not import figures into the text document.

Complete instructions for electronic artwork submission can be found on the Author Gateway, accessible through the journal home page. Submit written permission from the publisher and author to reproduce any previously published figures. Limit figures to the number necessary to present the message clearly. Figure resolution must be a minimum of 300 dpi. Type figure legends on a separate page, double-spaced after the references. Identify at the end of each legend and in alphabetical order all abbreviations in the figure. The cost of color reproduction must be paid by the author. **For color reproduction in print, you will receive information regarding the costs from Elsevier after receipt of your accepted article.** Please indicate your preference for color: in print or online only. [Further information on the preparation of electronic artwork.](#)

## **Tables**

Number each table in Arabic numerals (Table 1, 2, etc.) and title each table. Download each table as a separate Word file. Identify in alphabetical order at the bottom of the table all abbreviations used. When tabulating numbers of patients, use no more than 2 lines preferably only 1 line across per patient. Use a plus sign (+) to indicate “positive” or “present” a zero (0) for “negative” or “absent” and a dash (–) for “no information available” or “not done.” Do not use “yes”, “no” or “none.”

## ***Color artwork***

Please make sure that artwork files are in an acceptable format (TIFF (or JPEG), EPS (or PDF) or MS Office files) and with the correct resolution. If, together with your accepted article, you submit usable color figures then Elsevier will ensure, at no additional charge, that these figures will appear in color online (e.g., ScienceDirect and other sites) in addition to color reproduction in print. [Further information on the preparation of electronic artwork.](#)

## **Readers' Comments**

The author who submits a ‘letter’ should provide a cover letter to the Editor in Chief explaining why the letter should be published. The letter (as well as references) should be double-spaced, and limited, with few exceptions, to 2 pages. A title for the letter should be provided at the top of the page. A title page is not required. At the end of the letter, the writer's full name, highest degree, and city and state (or country if outside the US) should be provided followed by the date of submission. The author's institution should not be included.

A letter concerning a particular article in the *Journal* must be received (from authors within the US) within 2 months of the article's publication.

### **Brief Reports**

Reports on important new results that fall within the scope of the journal may be submitted under this category. These papers should not exceed 1,000 words in length and should be formatted as unstructured paragraphs. Table and figure legends are included within the word limit. An abstract is not required. Brief Reports may include one Table and Figure and up to 10 references. No supplementary material.

### ***Data references***

This journal encourages you to cite underlying or relevant datasets in your manuscript by citing them in your text and including a data reference in your Reference List. Data references should include the following elements: author name(s), dataset title, data repository, version (where available), year, and global persistent identifier. Add [dataset] immediately before the reference so we can properly identify it as a data reference. The [dataset] identifier will not appear in your published article.

### ***Preprint references***

Where a preprint has subsequently become available as a peer-reviewed publication, the formal publication should be used as the reference. If there are preprints that are central to your work or that cover crucial developments in the topic, but are not yet formally published, these may be referenced. Preprints should be clearly marked as such, for example by including the word preprint, or the name of the preprint server, as part of the reference. The preprint DOI should also be provided.

### ***Reference management software***

Most Elsevier journals have their reference template available in many of the most popular reference management software products. These include all products that support [Citation Style Language](#) styles, such as [Mendeley](#). Using citation plug-ins from these products, authors only need to select the appropriate journal template when preparing their article, after which citations and bibliographies will be automatically formatted in the journal's style. If no template is yet available for this journal, please follow the format of the sample references

and citations as shown in this Guide. If you use reference management software, please ensure that you remove all field codes before submitting the electronic manuscript. [More information on how to remove field codes from different reference management software.](#)

### Reference style

List all authors, year, volume, and inclusive pages for all journal references, and specific page numbers for all book references as shown below. Do not use periods after authors' initials or after abbreviations for titles of journals. Check *Index Medicus or Annals of Internal Medicine* (June 1982) as cited above for journal titles/abbreviations. Personal communications and unpublished observations do not constitute references, but may be mentioned within the text. Articles with incorrect reference formats will not be processed. Do not use “et al” – the names of all authors must be included. All references must be typed out at the end of the article on a new page.

- **Journal:** Harvey W, Herberden W, Withering W, Stokes W, Murrell W, Einthoven W, Osler W. Anomalies and curiosities of cardiology and cardiologists. Reflections of famous medical Williams. *Am J Cardiol* 1984;53:900-915.
- **Chapter in Book:** Cabot RC, White PD, Taussig HB, Levine SA, Wood P, Friedberg CK, Nadas AS, Hurst JW, Braunwald E. How to write cardiology textbooks. In: Hope JA, ed. *A Treatise on Disease of the Heart and Great Vessels*. London: Yorke Medical Books, 1984: 175-200.
- **Book:** Carrel A, Cutler EC, Gross RE, Blalock A, Craffoord C, Brock RC, Bailey CP, DeBakey ME. *The Closing of Holes, Replacing of Valves and Inserting of Pipes, or How Cardiovascular Surgeons Deal with Knives, Knaves and Knots*. New York: Yorke University Press, 1984:903.

### Video data

Elsevier accepts video material and animation sequences to support and enhance your scientific research. Authors who have video or animation files that they wish to submit with their article are encouraged to include links to these within the body of the article. This can be done in the same way as for an illustration or table by referring to the video or animation content and noting in the body text where it should be placed. All submitted files should be properly labeled so that they directly relate to the video file's content. To ensure that your

video or animation material is usable, please provide the files in one of our recommended file formats with a maximum size of 50 MB. Video and animation files supplied will be published online in the electronic version of your article in Elsevier Web products, including ScienceDirect: <https://www.sciencedirect.com>. Please supply still photos with your files: you can choose any frame from the video or animation or make a separate image. These will be used instead of standard icons and will personalize the link to your video data. For more detailed instructions please visit our video instruction pages at <https://www.elsevier.com/artworkinstructions>. Note: since video and animation cannot be embedded in the print version of the journal, please provide text for both the electronic and the print version for the portions of the article that refer to this content.

### **Data visualization**

Include interactive data visualizations in your publication and let your readers interact and engage more closely with your research. Follow the instructions [here](#) to find out about available data visualization options and how to include them with your article.

### **Supplementary data**

Elsevier accepts electronic supplementary material to support and enhance your scientific research. Supplementary files offer the author additional possibilities to publish supporting applications, high-resolution images, background datasets, sound clips, and more. Supplementary files supplied will be published online alongside the electronic version of your article in Elsevier Web products, including ScienceDirect: <https://www.sciencedirect.com>. To ensure that your submitted material is usable, please provide the data in one of our recommended file formats. Authors should submit the material in electronic format together with the article and supply a concise and descriptive legend for each file. For more detailed instructions please visit our artwork instruction pages at <https://www.elsevier.com/artworkinstructions>.

### **Research data**

This journal encourages and enables you to share data that supports your research publication where appropriate, and enables you to interlink the data with your published articles. Research data refers to the results of observations or experimentation that validate research findings,

which may also include software, code, models, algorithms, protocols, methods and other useful materials related to the project.

Below are a number of ways in which you can associate data with your article or make a statement about the availability of your data when submitting your manuscript. If you are sharing data in one of these ways, you are encouraged to cite the data in your manuscript and reference list. Please refer to the "References" section for more information about data citation. For more information on depositing, sharing and using research data and other relevant research materials, visit the [research data](#) page.

### ***Data linking***

If you have made your research data available in a data repository, you can link your article directly to the dataset. Elsevier collaborates with a number of repositories to link articles on ScienceDirect with relevant repositories, giving readers access to underlying data that gives them a better understanding of the research described.

There are different ways to link your datasets to your article. When available, you can directly link your dataset to your article by providing the relevant information in the submission system. For more information, visit the [database linking page](#).

For [supported data repositories](#) a repository banner will automatically appear next to your published article on ScienceDirect.

In addition, you can link to relevant data or entities through identifiers within the text of your manuscript, using the following format: Database: xxxx (e.g., TAIR: AT1G01020; CCDC: 734053; PDB: 1XFN).

### **Research Elements**

This journal enables you to publish research objects related to your original research – such as data, methods, protocols, software and hardware – as an additional paper in a [Research Elements journal](#).

Research Elements is a suite of peer-reviewed, open access journals which make your research objects findable, accessible and reusable. Articles place research objects into context by providing detailed descriptions of objects and their application, and linking to the

associated original research articles. Research Elements articles can be prepared by you, or by one of your collaborators.

During submission, you will be alerted to the opportunity to prepare and submit a manuscript to one of the Research Elements journals.

More information can be found on the [Research Elements page](#).

### ***Data statement***

To foster transparency, we encourage you to state the availability of your data in your submission. This may be a requirement of your funding body or institution. If your data is unavailable to access or unsuitable to post, you will have the opportunity to indicate why during the submission process, for example by stating that the research data is confidential. The statement will appear with your published article on ScienceDirect. For more information, visit the [Data Statement page](#).
